Persisting the data associated with a container (stateless)

- Create a volume using below command.

  docker volume create volume_name

- Check if the volume is created using below command

  docker volume ls

- Run the container by mounting the volume to appropriate folder.

  docker run - p 27017:27017 -v volume_name:/data/db mongo

- Insert some data inside mongo DB database.

- kill the container and rerun it using the command mentioned in step 3.

- See if you were able to persist the DB.
